

## Lesson 09 Exercise – Add Dynamic Values

### Objective

By the end of this exercise, you will be able to set Tosca to automatically enter dynamic values into your application in place of static values.

### Why is this important?

This is important because TestCases will be run repeatedly over long periods of time. Setting dynamic values means there is less maintenance due to checking/amending data, such as dates.

### Instructions

1. In your "01 Generate and Verify Sales Order" TestCase, in the "Header Data" TestStepFolder, locate the TestStep "Input Document Date". In the last exercise, we hardcoded tomorrow's date into the TestCase. We will now update the date Value to make it dynamic – every time the TestCase runs, the date will be updated.

TestStepValue	Value	Action Mode
Document date	{DATE[][+1d][dd.MM.yyyy]}	Input

To see a preview of the value being entered before running the TestCase, you can right click on the TestStepValue and select "**Translate Value**" from the context menu
